UNITRAQ BINARY MESSAGE STRUCTURE

The UniTraQ binary message comprises of binary string with length of up to 255 characters. It has the following format:

Format

%%<Message Start>Message Body><Message End><CR><LF>

Description		Value	
Leading Byte 1		%	25h
Leading Byte 2		%	25h
Message Start	Message Type		↓
	Message ID		
Message Body			Up to 250 bytes
Message End		Checksum Byte	<CS>
Ending Byte 1			xxh
Ending Byte 2		<CR>	0Dh
		<LF>	0Ah

Message Start: <Frame Type> <Frame ID>

Message Type: ACK (06h), NAK (15h), Input (F1h), Output (F2h)

Message ID: Number between 0x01, 0xEF

Message Body: Contains input parameter or output information related to the particular message.

Message End: Checksum byte. The checksum is calculated by performing exclusive-or, XOR, of all bytes from <Message Type> till the last byte prior to <Checksum Byte>:

$CS = CS \oplus \text{<Data Byte>}$, where initially $CS = 0$

Sample C-Code for Calculating Checksum

```
char BIN_ComputeChecksum( char* buf, int len )
{
    int i;
    char chksum;

    chksum = 0;
    for (i=0; i<len; i++ ) chksum ^= buf[i];

    return sum;
}
```

Sample Binary Message: The following binary message sets baud-rate to 19200.

25 25 f1 02 00 02 fd 7f 00 00 00 00 73 0d 0a

1. Binary Input Message Type <F1h>

This group of binary messages is used to configure the GPS receiver, or to request information from the GPS receiver. If the receiver carries out the command successfully, ACK binary message is returned; otherwise NAK binary message is returned.

Data Types Used

UINT08: 8bit unsigned integer	SINT16: 16bit signed integer
UINT16: 16bit unsigned integer	SINT32: 32bit signed integer
UINT32: 32bit unsigned integer	SPFP: 32bit single precision floating point number
SINT08: 8bit signed integer	DPFP: 64bit double precision floating point number

Byte Ordering

All data is in little-endian format, with low-order byte (LSB) at lower address.

ACK/NAK

An output ACK message indicates GPS accepts the message while NAK indicates GPS cannot execute the command at the moment. **However, an error input command will not get any acknowledge message from GPS.**

Description

Start/stop recording the user trace.

Parameter Distance is the distance between two contiguous recorded points. Time Period is the time between two contiguous recorded points. When one of two parameters reaches the criteria, this trace is recorded. If one of the parameter is 0, it is ignored. If both parameters are 0, the trace is recorded in every single second. When Recording time is 65535(0xFFFF), the trace is recorded continuously. When recording reaches the storage limitation, system will erase the earliest records to make space for newest records. Technically, it is a FIFO ring buffer.

Note: This ring buffer is consisted of 128 blocks in LS-40MM/CM/SM/EB. Each block contains 512 bytes. When ring buffer is full, system erases the oldest whole block to make room for incoming records. Users should see a 100% used percentage of ring buffer when ring buffer is full, however, the number of logged records may be reduced because the erased block contains more than one records while only one new coming record is added at that moment.

Parameters	Data (Range)	Type (Little-endian)	Unit	Byte #
Action	0: stop, 1: start	UINT08	-	1
Format	0: Packed data	-	-	2
Distance	0 ~ 65535	UINT16	Meter	3 – 4
Time period	0 ~ 65535	UINT16	Second	5 – 6
Recording time	0 ~ 65535 65535 (0xFFFF): no limitation (limitation in buffer size)	UINT16	Second	7 – 8

* This function is supported on LS-40MM/SM/CM/EB.

1.19 Read trace Log(1Eh)

Command	Read Trace Log (1Eh)	(Product dependent*)
String	%%<F1h><1Eh>< Parameter bytes><CS><CR><LF>	
Length	2 + 7 = 9	
Response	ACK	%%<06h><1Eh ><CS><CR><LF>
	NAK	%%<15h><1Eh ><CS><CR><LF>
	88h	Packed Trace data (See output message 88h)

Description

Start/stop reading the trace log.

A NAK message is returned when system is in recording. When logged records are outputting, the normal position messages (NMEA/Binary) are temporarily disabled until reading stops.
